

# FACTS AND HELPFUL HINTS ABOUT

## FIELD POINT TARGETS

For field point targets, we recommend rotating bag targets every 75-100 shots and frequently changing the bull's-eye being shot. This process will push fabric back to the area that has already been shot and increase the longevity of your target.

After many shots have been fired into your Morrell Target, lay your target face down on the side with the most shots into it. Stomp heavily on the back side of the target. This should move material around to areas that have been shot.

Hanging a target by the eyelets allows the target to swing. Permitting this swing motion when the arrow hits will allow for lost energy and increase the life of the target. Making sure that practice tips match the arrow shaft diameter will increase the ease of arrow removal. Most carbon shafts are 9/16 in., but shooters should check their local dealer on which size to use.

**BE SURE TO ADD LIFE TO ANY MORRELL ETERNITY TARGET BY PURCHASING AN X-TENDED LIFE COVER. A NEW COVER WILL PUT NEW LIFE INTO AN OLD TARGET!**
